## Development Landmark

A China-developed CH-5—*Caihong (Rainbow) 5*—unmanned aerial vehicle prepares to land at an airport in north China's Hebei Province on July 14 after a test flight, the model's first following the start of its mass production.

Unveiled in 2016, the CH-5 can conduct reconnaissance, surveillance, patrol, target positioning and strike missions, according to its developer, the China Academy of Aerospace Aerodynamics. It can also be used for civilian purposes such as resource surveys, marine environmental protection, disaster surveys, marine law enforcement and emergency response.
